

Hackathon Project: Automated & Unified Documentation Workspace

I. The Heart of Our Product: Our Documentation

Our documentation is much more than just a manual; it is a crucial extension of our product. For our **customers**, it is their guiding light - allowing them to independently navigate features, troubleshoot issues, and unlock the full value of our console, as well as reduce questions for our customer support teams. For our **employees**, it serves as the ultimate single source of truth. It bridges the gap between engineering, product, and support, ensuring everyone is aligned on how our tools actually work.

However, maintaining this vital resource is a daily, intensive effort. As our console evolves and scales, so must the guides that support it. Ensuring that every page reflects the latest UI changes, adheres to our tone, and remains perfectly accurate requires constant vigilance and cross-collaboration from our entire team.

II. Our Motivation

Because our product is ever-changing, maintaining an accurate documentation repository has become increasingly difficult. We are currently facing three significant operational bottlenecks:

Customers that use the documentation often complain about outdated content and images. Due to the everchanging UI and nature of the Upwind product, it's near impossible to maintain it 100% up to date manually.
